Paid Accounts Needed From You

Two accounts need to exist under your business, not mine, because each one needs a payment method tied to your card and your business identity from day one. Everything else the app depends on — including the subscription system itself — I can set up on my end and hand over ownership of at delivery, the same way I'm already doing with the backend.

For each one below: what it costs, where to set it up, the exact steps, and exactly what to send back to me once it's done. Start these as early as possible — they're the only things on the critical path that I can't move forward without.

Quick summary

Item	Cost	Needed for
1. Apple Developer Program	\$99 / year	iPhone app + App Store submission
2. Google Play Console	\$25 one-time	Android app + Play Store submission

1. Apple Developer Program

Cost: \$99 USD / year, charged directly by Apple to your card

Website: developer.apple.com

Needed for: Submitting the iPhone app to the App Store, "Sign in with Apple" login, and letting the subscription system verify Apple purchases

Time to verify: Usually same day for an individual account; 1–2 weeks if enrolling as a registered business (Organization) with a D-U-N-S number

Steps

1. Go to developer.apple.com and sign in with (or create) the Apple ID you want this business account tied to permanently — this becomes the account of record for the App Store listing.
2. Click "Account", then "Enroll" in the Apple Developer Program.
3. Choose entity type: "Individual / Sole Proprietor" is fastest (verifies against your personal legal name). "Organization" requires a D-U-N-S number (a free business ID Apple can look up or help you request) and takes longer, but lists the app under your company's legal name rather than yours personally — recommended if you want the store listing to show your business name as the publisher.
4. Pay the \$99/year fee. Apple emails confirmation once approved (individual accounts are usually near-instant; organization accounts can take 1–2 weeks due to D-U-N-S verification).
5. Once approved, go to appstoreconnect.apple.com → Users and Access → add me as a user with the "App Manager" role (or "Admin" if you'd rather I have broader access). Use my email — I'll confirm which one to use.

What to send me once done

- Confirmation that enrollment is approved and active.
- Your Apple Developer Team ID (Account → Membership Details, a 10-character code).
- Confirmation you've invited me on App Store Connect as App Manager/Admin.

2. Google Play Console

Cost: \$25 USD one-time (not yearly), charged directly by Google to your card

Website: play.google.com/console

Needed for: Submitting the Android app to Google Play, and setting up Google Play Billing so the subscription system can process Android purchases

Time to verify: Google has been requiring identity verification for new accounts, which can take a few days — start this early

Steps

1. Go to play.google.com/console and sign in with the Google account you want to permanently own this app listing (a dedicated business Gmail is worth creating now if you don't already have one for the company).
2. Click "Create account", choose "Organization" if you have a registered business (recommended — shows your company name publicly) or "Individual" otherwise.
3. Pay the one-time \$25 registration fee.
4. Complete Google's identity verification (a government ID and sometimes a short video or phone step — this is the part that can take a few days).
5. Once approved, go to Users and permissions → Invite new user → add me with "Admin" access (or a custom role covering Release management and App content, if you'd rather limit it).

What to send me once done

- Confirmation the Play Console account is verified and active.
 - Confirmation you've invited me as a user with release/admin access.
-

Everything else, handled and transferred at delivery

The subscription/paywall system (RevenueCat), the backend database (Supabase), "Continue with Google" login, and the admin panel's hosting are all things I set up under my own accounts while building, and hand over to you as part of final delivery — the same way a contractor hands over the keys at the end of a job, not partway through. None of these cost anything to set up, and none of them hold your money or banking details — actual payments and payouts run through Apple and Google directly, into whatever bank details you add inside App Store Connect and Play Console once items 1 and 2 above are set up.

A couple of small things not covered here — the privacy policy text and a support email, plus app icon/store screenshots — I'll ask you for closer to launch, since there's nothing to review yet.

Questions on any step — just ask.
